Twokey

Live on Arc mainnet

The two-key rule for AI agents that move USDC.

Routine payments run on their own. Risky ones wait for a human key sealed to the exact terms. Rule-breakers are refused. Every decision is on a hash-chained record. Built on Circle Wallets and Arc.

twokey.si github.com/PrabalParihar/twokey-arc Circle Grants · 2026 Cohort 2

Agents can pay bills now. Nobody can safely let them.

A wallet is all or nothing

Give an agent wallet credentials and it can pay anyone, any amount. Take them away and it can't do the job.

Caps are yes or no

Spend limits and allowlists either let a payment through or fail it. The payments that matter most, a new vendor or a bigger invoice, need a person in the loop.

The fraud is in the details

"Our wallet changed, pay this address." The name matches; the address doesn't. Business email compromise works the same way on agents.

Finance teams need three things before they let an agent touch a treasury: a mandate the agent can't exceed, a person who signs the exceptions, and a record they can check without trusting the agent.

Twokey decides every payment, in one of four lanes.

✓ Inside the mandate

Pays on its own through Circle Wallets on Arc, in seconds, with the tx hash on the record.

✋ Needs you

New payee or over a cap: waits for a hold, sealed with SHA-256 over amount, address, chain, token, memo and expiry.

↻ Sending

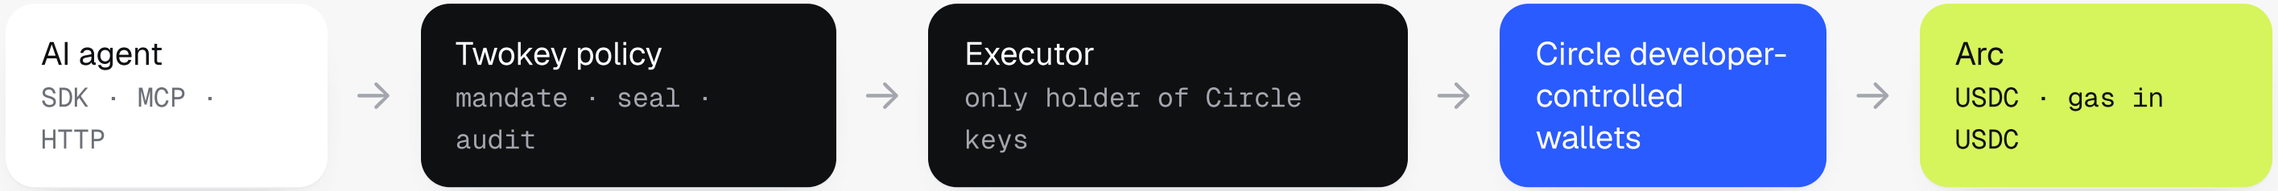

Right before paying, the executor re-classifies and re-verifies the seal. One changed cent voids it.

⊘ Refused

A pinned name at a new address, over the hard max, or short on USDC for amount + gas: blocked before any Circle call.

The agent holds only a Twokey key. It can ask; it can never approve, and it never sees a wallet id. Approvals happen in the console or on Telegram.

Circle and Arc are the rails, not an add-on.

Circle Wallets

createWalletSet · createWallets · createTransaction (idempotency key written ahead) · getTransaction · getWalletTokenBalance · listTransactions · v2 webhooks, signature-verified · faucet

Arc

Settlement for every payment. Gas is USDC from the same wallet, so the policy keeps amount + fee ≤ balance and a reserve. Sub-second finality: COMPLETE is final when we record it.

Shipped, live and verifiable.

5042

Arc mainnet: Twokey's own treasury on Circle LIVE keys, 5 USDC hard cap

~1 min

to a self-serve sandbox: own Circle wallet, test USDC, mandate, agent key

20 / 20

crash and timeout runs paid exactly once on Arc Testnet

182

tests: unit and Postgres integration; policy at 100% branch coverage

twokey.si/demo

Anyone countersigns a real Arc Testnet payment, no sign-up: 29 visitor payments settled so far.

twokey.si/signup

Self-serve sandboxes on Arc Testnet, with Telegram approvals and the agent's badge.

Open source

github.com/PrabalParihar/twokey-arc, with a Circle transcript mapping every call to file and line.

Caps exist everywhere. Sealed approvals don't.

	Spend caps	Allow / block lists	Human second key per payment	Approval voids on any change	Payee pinned to its address	Hash-chained audit with Arc tx
Circle Agent Stack policies	✓	✓	—	—	—	—
Typical agent-wallet spend controls	✓	✓	—	—	—	—
Twokey	✓	✓	✓	✓	✓	✓

Twokey is complementary to Circle's own controls: it sits in front of the same wallet, as defense in depth, and turns "denied" into "ask a person".

Go to market: start free, move to mainnet on your own Circle account.

Who

Finance and ops teams putting AI agents on accounts payable, vendor payouts and API spend; and the agent builders who sell to them.

How

Self-serve sandbox on testnet → design partners on mainnet with their own Circle Live account, so Twokey never custodies anyone's funds.

Where it spreads

One SDK call or an MCP tool for any agent framework; Telegram approvals for the person; an open-source core teams can audit.

No paying users or revenue yet, stated plainly. The next 10 weeks are about three design partners moving real USDC on Arc mainnet.

Milestones and the ask: $10,000 USDC.

Milestone	What exists at completion	Circle products	When
M0 · done	Live on Arc mainnet for Twokey's treasury; self-serve testnet sandbox; public demo	Wallets, USDC	Oct 29, 2026
M1 · $4,000	Design partners on their own Circle Live accounts; passkey step-up on approve; required webhooks; 3 partners moving real USDC on Arc mainnet	Wallets, USDC	weeks 1–4
M2 · $6,000	Cross-chain payees under the same mandate, sealed into the approval; open quickstart, example agent and MCP package	CCTP V2, Gateway, App Kits	weeks 5–10
M3 · stretch	Agent cards and paid APIs under the same mandate: card authorizations and x402 calls ask the mandate first	Agent Stack, Nanopayments	after M2

Prabal Pratap Singh, founder

Senior full-stack engineer in AI agents and blockchain, six years shipping. Full Stack Blockchain Lead at Warlands (CopyPool: Uniswap V4 liquidity automation, live on Base mainnet). Before that Mai Labs (15+ production contracts, $2M+ TVL), KalpStudio (5K+ gasless meta-transactions), CredShields.

10 hackathon wins since 2021, including ETHGlobal, ETHIndia, Polygon BUIDL IT and Encode Club Bangkok, and a $10K Gitcoin grant. Building Twokey with WitLabs (Witlabs Services Pvt Ltd), Lucknow, India.
